

Summary

Due to fever happens in the week, I may not cover everything from the lecture.

This week, the course covered in two-part. The Tuesday part is Website structure and planning. This part is helping us in planning a website with a clear structure. We have been introduced the Web development phases and questions, which contain 5 parts including **planning, analysis, design and development, testing and implementation and maintenance.** We had learned who will be involved in website development. The wireframe was introduced to design the website UI. And it is really important.

Thursday's course focus on CSS selector. There are three types of it, **Type, Class, and ID.** There are different purposes and usage for those selectors. We talked about **Pseudo-classes.** Because we do not have a demo for it now, I cannot see the real-life implementation yet. Therefore, not fully understand it. **H5 element** was important, and **semantic/ non-semantic HTML elements.**

Question for Mid-term

How to apply CSS font-size 12px to class attribute "focus" on paragraph

A:

```
p.focus{  
    font-size: 12px;  
}
```

Surprise or confused topic

This week I found out the planning for a website is really important. I did not think of all the procedures and workflows are involved. I do see the reason behind it. I should take look at the development phases and use them for my project for the best effort.
