

Week 6 Summary

Summary

This week we talked about layout in CSS. We have introduced **block elements** and **inline elements**. By knowing which are block or inline, I can apply the correct attribute when styling the pages. I also learned layout properties like **Float, Display, Position**. I can use those properties to arrange the element's position on the page.

In Thursday's class, I learned the CSS **FlexBox**. This is an important concept that it allows me to create grid style for webpage more conveniently, meanwhile flexbox support responsive element that really helps with mobile version webpage development.

Surprise or confused topic

I have a little bit confused about the flexbox arrangement. Especially when hands-on in Thursday's Lab, I thought I am able to make the webpage by my understanding. But I still need to check the code from example and code in class. I find I am not fully understanding how to use flexbox, and create a grid using it. I will lookup more documentation from W3C and Mozilla to help me understand this concept.
