Week 7 Summary

Summary

This week, CSS Frameworks was introduced. It helps me to learn how to format a webpage in a nice layout. I learned it is unnecessary to take up all the space for the webpage, set a page container with a width of 960px or 1200px is good enough. We can format the page using things called the grid system.

The rest of the class is to create a starter file for homework. It shows to create a webpage with different elements is hard.

Surprise or confused topic

A fix page width for the webpage is interesting for me. I do not know what will happen in next week's class about responsive design will deal with them. I try to format my Github index page using a page container, but it certainly breaks the responsive design that originally has when not using a page container.
