

## Week 9 Summary

### Summary

---

This week we have learned about the form on a website and accessibility. As more people have the technology available these days, it is important to let everyone able to use it. Therefore, accessibility is important that more people can use the Internet for more knowledge and information. Several things we learned for the accessibility:

1. Make the website keyboard friendly. Try to make the website to be accessible using just a keyboard. Especially for form, let the user use the 'Tab' key to navigate.
2. Provide 'alt' attribute for an image, use the title attribute for providing extra information.  
Using descriptive link text, make the user understand where the link goes instead of putting the URL on the page.
3. Keep color contrast up. Avoid using similar colors in background and text.
4. ARIA labels.

We learned to use tools to validate the accessibility of the webpage. WebAIM has a handy tool and browser extension to use.

We also learned about HTML form this week. The form can be used in many occasions; it is important to know how to use it correctly.

### Surprise or confused topic

---

The importance of web accessibility is something I should more consider when I am working for my final project website. It is important to have the openness and friendliness to all the user on the Internet.
